What Is Suboxone?

Suboxone is a prescription medication used to treat opioid dependence. Its generic name is Buprenorphine/Naloxone, a combination designed to reduce cravings while preventing misuse. Buprenorphine acts as a partial opioid agonist, helping ease withdrawal symptoms, and Naloxone serves as a deterrent to abuse by blocking euphoric effects if misused.

This treatment has become one of the most effective methods for long-term opioid recovery. Healthcare providers often recommend Suboxone because it supports stability and gradual healing without the intense highs or lows experienced with other opioids.
